

Today's latest technology for quickly and painlessly evaluating liver health.

FibroScan works by emitting a pulse of energy, which you may feel as a slight vibration on your skin. FibroScan then measures the speed of this energy and immediately provides this information to your physician, who then uses it as part of a broader evaluation of your liver health.

FibroScan offers many benefits:

- Consistent results
- The examined area is 100x the size of a needle biopsy
- Covered by most insurance plans
- The procedure is painless and takes about 10 minutes

What is FibroScan®?

An examination with FibroScan®, is a painless way to understand your liver health.

When performed as part of an overall evaluation, FibroScan® provides valuable information for healthcare providers that might otherwise only be available from a liver biopsy.

The FibroScan® examination is painless, quick and easy.

FibroScan® non-invasively measures the stiffness of your liver by capturing and calculating the speed of a shear wave as it travels through the liver.

This detection of stiffness may be used as an aid to clinical management of liver disease.

During the scan, you will only feel a slight vibration on the skin at the tip of the probe.
